OLA Ride Booking Analysis

Business Insights & Recommendations

Scope: Preliminary interpretation of the supplied Overall Power BI dashboard and the SQL views shared for this project.

1. Executive Summary

The visible Overall dashboard reports approximately **103.024K bookings**. The booking-status chart indicates that about **62.09%** of bookings are successful, while the remaining **37.91%** fall into the three displayed unsuccessful categories. Customer cancellations are the largest of those categories. This points to an opportunity to investigate cancellation drivers and improve the booking-to-completion experience.

2. Booking Status Breakdown

Booking status	Bookings shown	Share shown
Success	63.97K	62.09%
Canceled by Customer	18.43K	17.89%
Canceled by Driver	10.50K	10.19%
Driver Not Found	10.12K	9.83%

Insight 1 — Successful booking share: Roughly 62 out of every 100 bookings are shown as successful. This is a useful headline service KPI, but it should be calculated from the underlying rows and checked against the exact date filter used in the dashboard.

Insight 2 — Customer cancellations: Customer cancellations account for about 17.89% of all bookings and are the largest single unsuccessful category in the chart. Review the customer-cancellation reason field, booking time, pickup location, vehicle type, and lead/wait time to identify patterns.

Insight 3 — Driver-side supply issues: Driver cancellations (10.19%) and Driver Not Found (9.83%) together represent approximately 20.02% of bookings. This suggests investigating driver availability, vehicle coverage, peak-hour supply, and pickup-area imbalance.

Insight 4 — Unsuccessful bookings overall: The three non-success categories total approximately 37.91%. This is a substantial share of booking activity and should be monitored as a core operational KPI.

3. Ride Volume Over Time

The line chart shows daily booking counts fluctuating across the displayed July date range, with visible day-to-day variation rather than a consistently rising or falling pattern. The chart alone does not establish the cause of these changes. Compare weekday versus weekend demand, hour of day, vehicle type, and cancellation status before recommending staffing or supply changes.

4. SQL Analysis Available

SQL analysis	Business question it supports
Successful bookings	Which booking records reached Success status?
Average ride distance by vehicle	How does average distance differ by vehicle category?
Customer cancellations	How many bookings were canceled by customers?
Top five customers	Which customers have the highest booking counts?
Driver cancellation reason	How many driver cancellations cite personal/car-related issues?

SQL analysis	Business question it supports
Prime Sedan driver rating range	What are the maximum and minimum driver ratings for Prime Sedan?
UPI bookings	Which bookings used UPI?
Average customer rating by vehicle	How do customer ratings vary by vehicle type?
Successful booking value	What is the summed booking value for successful bookings?
Incomplete rides	Which rides are marked incomplete and what reasons are recorded

5. Business Recommendations

- **Investigate customer cancellations:** Break down customer cancellation reasons by hour, pickup location, and vehicle type. Prioritize the largest reason categories.
- **Improve driver availability:** Compare Driver Not Found and driver-cancellation rates across time slots and pickup zones. Consider targeted driver positioning during periods with repeated shortfalls.
- **Track a consistent KPI set:** Monitor total bookings, successful bookings, success rate, customer cancellation rate, driver cancellation rate, Driver Not Found rate, incomplete-ride rate, and average booking value.
- **Segment performance:** Compare ride distance, ratings, booking value, and cancellation rates by vehicle type rather than relying only on overall averages.
- **Use customer feedback:** Review customer and driver rating distributions together with booking status to understand service-quality patterns.

6. Data Validation and Limitations

- The booking counts and percentages above are read from the supplied dashboard screenshot and are approximate because the visuallabels are rounded.
- The chart's total (about 103.024K) and category values appear consistent within rounding, but must be confirmed from the source tableand the Power BI filter context.
- The second KPI card is labelled “Total Bookings” and displays “35M”. Its meaning is unclear from the screenshot. Confirm themeasure; if it represents booking value/revenue, rename it and display the correct currency.
- The screenshot does not establish the currency for Booking_Value, the unit for Ride_Distance, or the units for V_TAT and C_TAT. Confirm these before using them in business recommendations.
- The supplied SQL files define useful views, but the query result rows were not supplied. Therefore, this report does not invent averagedistances, customer rankings, rating values, payment shares, or successful booking value.
- The SQL view for top customers counts bookings per Customer_ID across all booking statuses. If the business question is aboutcompleted rides, filter to successful bookings as a separate measure.
- The average ride distance and average customer rating views currently group all rows by vehicle type. Consider whether canceled orincomplete bookings should be excluded for each metric.
- The source screenshot contains text values such as “null” and a “#NAME?” spreadsheet cell in a Vehicle Images column. Confirmwhether these are source values or spreadsheet artifacts and clean them appropriately.

7. Next Steps to Strengthen the Analysis

- Validate the status totals with SQL using COUNT(*) and conditional aggregation.
- Calculate cancellation and success rates with a clearly defined denominator.
- Run each SQL view and add the actual result tables to the report.
- Add vehicle-type, revenue, cancellation, and ratings dashboard screenshots.
- Add monthly, weekday, and hourly demand analysis, plus location-level cancellation analysis.
- Create Power BI measures for success rate, cancellation rate, average booking value, and average ride distance.

Conclusion: The initial dashboard highlights a successful-booking share of about 62.09% and shows customer cancellations as the largest single unsuccessful category. The most valuable next step is to validate these headline

figures in SQL and connect cancellation patterns to time, location, and vehicle type. This will turn the dashboard from a descriptive report into a stronger business analysis.
